

## SOP: AfyaSTAT INSTALLATION ON UBUNTU ENVIRONMENT

This is a technical user guide on the process of AfyaSTAT installation and configuration. The document outlines the process as installed on Ubuntu Desktop and Ubuntu Server (Version 16.04).

**Objective:** To provide simplified guidance to users on how to install AfyaSTAT Application in Ubuntu environment.

**Target audience:** SI, Dev, M&E

Last Update: 7<sup>th</sup> Aug 2021

AfyaSTAT Dependencies: The following dependencies are required for successful AfyaSTAT installation and operation. Ensure all of them are correctly installed:

- i. Docker-CE
- ii. Docker-Compose
- iii. Node JS
- iv. Python
- v. PM2
- vi. PIP
- vii. Medic configuration
- viii. Git

### Installation of Ansible

1.
  - i. Add Ansible ppa:
  - ii. Install Ansible:

```
sudo apt-add-repository ppa:ansible/ansible
```

```
sudo apt update
```

```
sudo apt install ansible
```

```
botienoh@botienoh: ~  
└─$ Using username "botienoh".  
botienoh@192.168.43.58's password:  
Welcome to Ubuntu 16.04.5 LTS (GNU/Linux 4.15.0-29-generic x86_64)  
  
 * Documentation:  https://help.ubuntu.com  
 * Management:    https://landscape.canonical.com  
 * Support:       https://ubuntu.com/advantage  
  
513 packages can be updated.  
438 updates are security updates.  
  
New release '18.04.5 LTS' available.  
Run 'do-release-upgrade' to upgrade to it.  
  
botienoh@botienoh:~$ sudo apt-get update  
[sudo] password for botienoh:  
Hit:1 http://ke.archive.ubuntu.com/ubuntu xenial InRelease  
Hit:2 http://ke.archive.ubuntu.com/ubuntu xenial-updates InRelease  
Hit:3 http://ke.archive.ubuntu.com/ubuntu xenial-backports InRelease  
Get:4 http://security.ubuntu.com/ubuntu xenial-security InRelease [109 kB]  
Fetched 109 kB in 1s (67.3 kB/s)  
Reading package lists... Done  
botienoh@botienoh:~$ sudo apt-get install ansible
```

### Set Environment Variable

Obtain the .bash script (**setvariables.sh** file) for setting up the environment variables. Copy the file to Home directory and make it executable by running the following command.

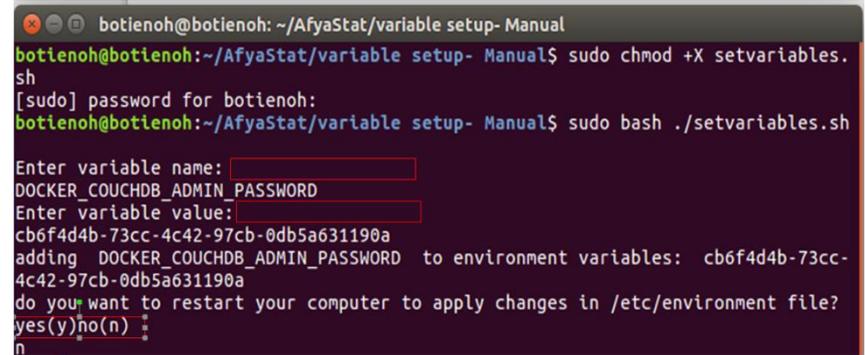

```
sudo chmod +x setvariables.sh
```

Execute the script using the following command

```
sudo bash ./setvariables.sh
```

Set the following variables as prompted namely:

2. - Variable name:
- Value:

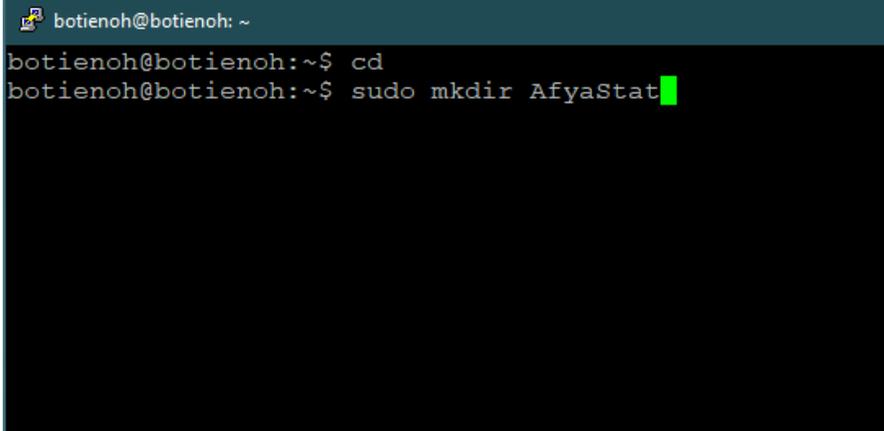

```
botienoh@botienoh: ~/AfyaStat/variable setup- Manual
botienoh@botienoh:~/AfyaStat/variable setup- Manual$ sudo chmod +X setvariables.sh
[sudo] password for botienoh:
botienoh@botienoh:~/AfyaStat/variable setup- Manual$ sudo bash ./setvariables.sh
Enter variable name: DOCKER_COUCHDB_ADMIN_PASSWORD
Enter variable value: cb6f4d4b-73cc-4c42-97cb-0db5a631190a
adding DOCKER_COUCHDB_ADMIN_PASSWORD to environment variables: cb6f4d4b-73cc-4c42-97cb-0db5a631190a
do you want to restart your computer to apply changes in /etc/environment file?
yes(y)no(n)
n
```

When prompted to restart the machine, **select No (n)** and re-execute the script until all the three variables are set. The variables are:

Variable Name	Value
DOCKER_COUCHDB_ADMIN_PASSWORD	cb6f4d4b-73cc-4c42-97cb-0db5a631190a
COUCH_URL	<a href="http://medic:cb6f4d4b-73cc-4c42-97cb-0db5a631190a@localhost:5988/medic">http://medic:cb6f4d4b-73cc-4c42-97cb-0db5a631190a@localhost:5988/medic</a>
COUCH_NODE_NAME	nonode@nohost

Once all the three variables are set and prompted to restart machine, select Yes (y) and press enter. Wait for the computer to reboot.

	<p><b>Copy necessary files into a folder created in the home directory</b></p> <p><b>A: Ubuntu Server:</b></p> <ol style="list-style-type: none"> <li>i. Please wait till the process completes.</p>	<pre>botienoh@botienoh:~\$ cd AfyaStat/ botienoh@botienoh:~/AfyaStat\$ sudo bash root@botienoh:~/AfyaStat# ansible-playbook -i hosts afyastatinstall.yml [WARNING]: Unable to parse /home/botienoh/AfyaStat/hosts as an inventory source [WARNING]: No inventory was parsed, only implicit localhost is available [WARNING]: provided hosts list is empty, only localhost is available. Note that the implicit localhost does not match 'all'  PLAY [localhost] *****  TASK [Gathering Facts] ***** ok: [localhost]  TASK [Install aptitude using apt] ***** ok: [localhost]  TASK [Install prerequisites for Docker repository] ***** ok: [localhost]  TASK [add docker apt key] *****</pre>
------------------	---	---

5.

### Finish up the installation and launch AfyaSTAT

#### A. Restart Docker container and Haproxy

Return to Home: Type `cd [ENTER]`

```
sudo docker restart haproxy
```

```
sudo docker restart medic-os
```

Check the logs to ensure everything works ok.

```
sudo docker logs -f medic-os
```

If CouchDB fails to start correctly, go to Troubleshooting section for possible solutions

#### B. Restart the Listener:

Navigate into AfyaStat folder and execute the following scripts.

```
sudo pm2 stop listener.js
```

```
sudo pm2 flush
```

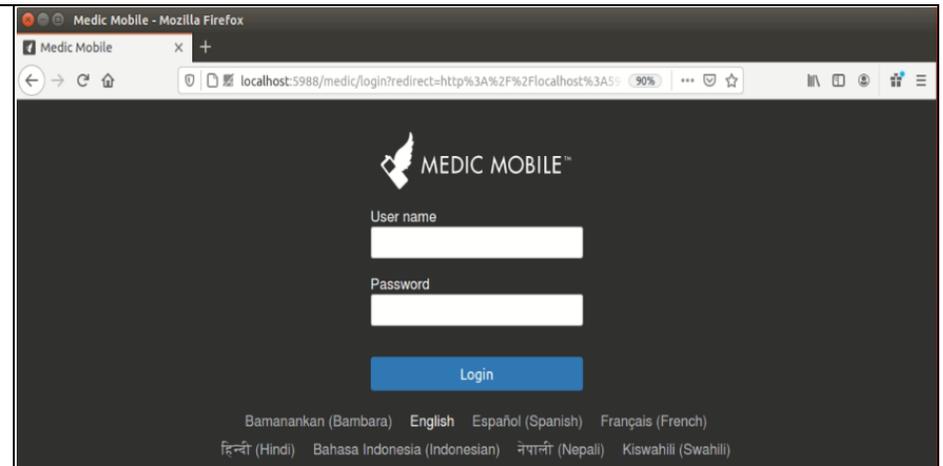

```
sudo pm2 start listener.js
```

#### C. Use below command to check logs:

```
sudo docker logs -f medic-os
```

#### D. Launch the AfyaSTAT application

Access the application on this link: <https://localhost:7200/>  
(Mozilla Firefox browser is most preferred.)

*NB: Please accept the security exception warning by the browser due to non-recognized https license.*

## 6. i TROUBLESHOOTING AFYASTAT INSTALLATION

Try the following if your instance of Afyastat fails to start. You can identify the issue by checking the medic-os logs. Here are possible errors

### i. CouchDB failed to start properly.

a) Check if the environment variables are set password is set correctly

```
echo $DOCKER_COUCHDB_ADMIN_PASSWORD
echo $COUCH_URL
echo $COUCH_NODE_NAME
```

**NB:** where the settings are incorrectly set, clear all the docker container for **haproxy** and **medic-os** and reboot.

- Manually update the variables correctly
- Re-install docker container for medic-os by executing the following command:  

```
sudo docker-compose -f kenyaemr-medic-os-compose.yml up -d
```
- Proceed from step 5 above.

b) Check to make sure CouCHDB password is set under haproxy section in the .yml file

c) Try Restarting haproxy and medic-os

```
sudo docker start haproxy
sudo docker start medic-os Wait for a couple of minutes (5min max)
```

d) Check if there is port conflict with :5988 by running this command: `sudo lsof -i : 5988`  
Consider killing IPV6 process and restart **haproxy** and **medic-os**

6. ii	<p><b>Clear any previous docker deployments (Optional).</b> This step applies only to instances where there was a previous attempt to install <b>Afyastat</b> on the current server. Otherwise skip if this is a fresh installation.</p> <pre>sudo docker stop haproxy sudo docker ps -all sudo docker stop medic-os sudo docker rm medic-os sudo docker rm haproxy sudo docker volume list sudo docker volume rm medic-data sudo docker system prune -a --volumes</pre>	
-------	--	--

## SECTION 2: UPLOADING FORMS & APPLICATION SETTINGS INTO AfyaSTAT

1	<p><b>Install Medic</b> Execute the following set of commands to install the medic configurations.</p>	<pre>sudo npm install -g medic-conf  sudo python -m pip install git+https://github.com/medic/pyxform.git@medic- conf1.17#egg=pyxform-medic</pre>
---	--	--

2

**Edit the App Settings file:**

- Open the **app\_settings.json** file
- Change all the base URLs to the IP Address of the KenyaEMR server.  
e.g. base URL `http://192.168.1.4:8080/`

**NB:** Due to the `ssl` issues, it is best to change the base URL to the IP Address of the machine even if the host is `localhost`.

```
"outbound": {
  "cht_client_registration": {
    "relevant_to": "doc.type === 'contact' && doc.contact_type === 'universal_client' &&
    "destination": {
      "base_url": "http://localhost:8080/",
      "auth": {
        "type": "basic",
        "username": "admin",
        "password_key": "kenyaemr"
      },
      "path": "/openmrs/ws/rest/v1/edata/medicregistration"
    },
    "mapping": {
      "registration": "doc",
      "timestamp": "doc.reported_date"
    }
  },
  "cht_client_registration_update": {
    "relevant_to": "doc.type === 'contact' && doc.contact_type === 'universal_client' &&
    "destination": {
      "base_url": "http://localhost:8080/",
      "auth": {
        "type": "basic",
        "username": "admin",
        "password_key": "kenyaemr"
      },
      "path": "/openmrs/ws/rest/v1/edata/medicdemographicupdates"
    },
    "mapping": {
      "demographicUpdate": "doc",
      "timestamp": "doc.reported_date"
    }
  }
},
}
```

	<p><b>Uploading App Settings and forms:</b> Navigate into the afyaSTAT forms folder and run the following script to upload the app settings run the following command in the terminal.</p> <p>Wait for the script to upload all the required forms.</p>	<pre>sudo medic-conf --url=https://medic:cb6f4d4b-73cc-4c42-97cb-0db5a631190a@localhost:7200 upload-app-settings delete-all-forms upload-app-forms upload-contact-forms upload-resources upload-custom-translations --accept-self-signed-certs</pre>  <p><b>NB:</b> Select 1 when prompted to confirm modification of the configuration and press <b>ENTER</b></p>
3	<p><b>Setting up AfyaSTAT configurations</b></p> <p>Refer to the link provided to access the configuration guide for both KenyaEMR and AfyaSTAT side. It is recommended to complete configurations on the AfyaSTAT side before proceeding to KenyaEMR side.</p>	<p><b>Link to Configuration file:</b></p> <p><a href="https://drive.google.com/file/d/17mYPEhfY1rdmvpYCBkvylHAUC-yj6ZTQ/view?usp=sharing">https://drive.google.com/file/d/17mYPEhfY1rdmvpYCBkvylHAUC-yj6ZTQ/view?usp=sharing</a></p>

## Setting medic-os and listener to auto restart on reboot

```
4 root@botienoh:~# sudo bash
root@botienoh:~# docker ps -a
CONTAINER ID   IMAGE                                PORTS   NAMES      COMMAND
STATUS
343c0130f1cc   medicmobile/medic-os:cht-3.9.0-rc.1  "/bin/bash -l /boot/..."
Exited (137) 20 minutes ago           medic-os
3b4d799153de   medicmobile/haproxy:rc-1.16         "/entrypoint.sh -f /..."
Exited (137) 20 minutes ago           haproxy
root@botienoh:~# docker update --restart unless-stopped 343c0130f1cc
343c0130f1cc
root@botienoh:~# docker update --restart unless-stopped 3b4d799153de
3b4d799153de
root@botienoh:~# sudo reboot now
```

## Configuring medic-os to start listener.js on system reboot

```
sudo bash
docker ps -a
docker update --restart unless-stopped medic_os_container_id (obtained from the
command above)
docker update --restart unless-stopped haproxy_id_container_id (obtained from the
command above)
```

## Configuring pm2 to start listener.js on system reboot

- i. Navigate into the folder with listener.js
  - ii. Configure pm2 to start on reboot by issuing the command `pm2 startup`. This will automatically detect the default service used by the system and will generate appropriate command to add pm2 to the service. Please note that the command should be executed without sudo in order to capture the correct user
  - iii. If the current user is not sudo, please switch users using `sudo su username`.
  - iv. Copy and execute the code as is.
  - v. Execute `sudo pm2 start listener.js` to start the script
  - vi. Execute `sudo pm2 save` to add the script to the list of those to be started on reboot
- Reboot when done.

THE END
